INTERNAL BRIEFING · 14 JULY 2026

The Financial System: what we've built so far

A plain-language walkthrough — no accounting background needed.

62%

of the 85 planned features are finished and running.
3 more are partly done.

START HERE

What *is* a digital financial system?

It is the company's **memory for money**. Every euro that comes in or goes out gets written down — automatically, permanently, and in a way that can be checked. Think of the notebook a shopkeeper keeps, except it cannot be lost, cannot be quietly edited, and adds itself up.

1

It records

Every bill, invoice, expense claim and bank payment is captured once and kept forever — with who did it, when, and what it was for.

2

It checks itself

Money never appears from nowhere. Each entry is written twice — where it came from and where it went — and the two sides must match, or the system refuses to save it.

3

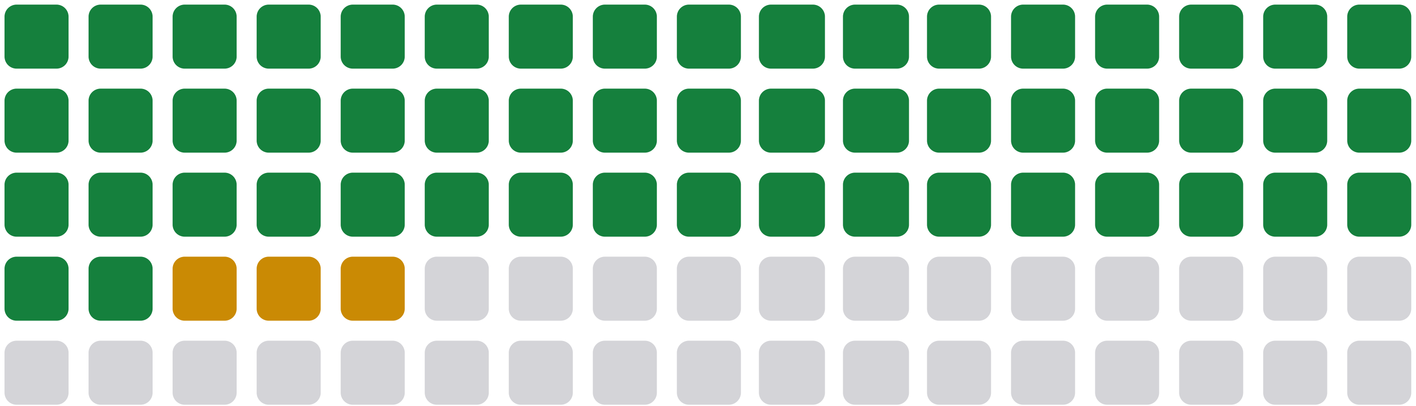
It reports

Because everything is recorded the same way, the system can answer "did we make money?", "what do we owe?", "how long does our cash last?" — from real data, not a spreadsheet guess.

WHERE WE ARE

85 features were planned. Here is every one of them.

One square = one feature. Nothing hidden, nothing rounded up.



53
Built and running

3
Partly built —
the core works, edges remain

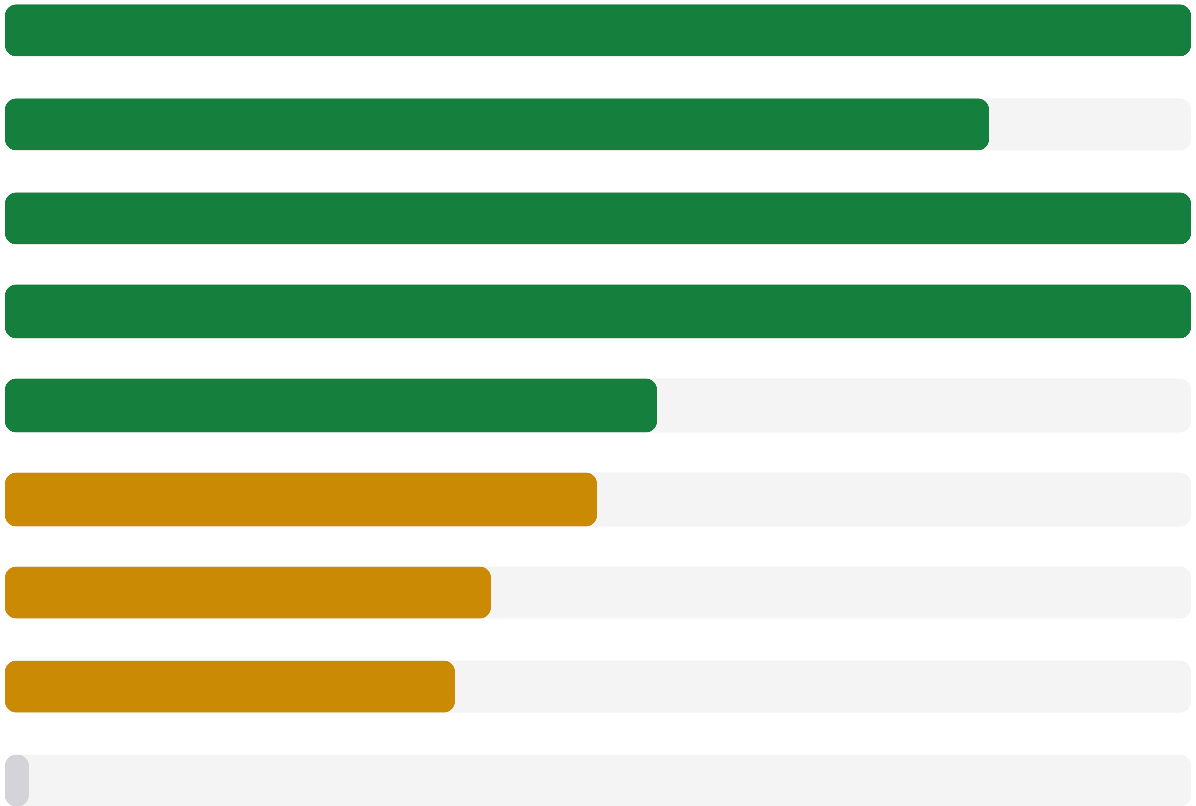
29
Not started yet

62%
fully complete
(66% if partials count)

WHERE WE ARE

Progress by area

The foundation is finished. The everyday money work is largely done. The forward-looking and payroll parts are the gap.



The books themselves Accounts, the ledger, monthly periods	**100%**
Tax & year-end VAT, tax reports, closing the year	**83%**
Matching the bank Import the statement, match it automatically	**100%**
Money in & money out Bills, invoices, expense claims, payments	**100%**
The financial statements Profit & loss, balance sheet, cash flow	**55%**
Planning ahead Budgets, runway, forecasts	**50%**
What each project really costs Cost centres, project profit, waste	**41%**
Who's allowed to do what Roles, approvals, safeguards	**38%**
Salaries & equipment Payroll, fixed assets, depreciation	**0%**

WHAT WORKS TODAY

The money already flows through it

Four everyday journeys are live. Each one ends in the same place — the ledger — which is why the reports can be trusted.

Money out	**Bill arrives** from a supplier	→	**Someone approves** not the person who entered it	→	**We pay it** full or partial	→	**Recorded** cash down, debt cleared
Money in	**We invoice** a customer	→	**They pay** fully or in part	→	**We chase** overdue list, 30/60/90 days	→	**Recorded** cash up, owed cleared
Expenses	**Staff claim** with a receipt	→	**Manager approves**	→	**Reimbursed** paid back once, never twice	→	**Recorded** as a cost
The bank	**Import statement** from the bank	→	**Auto-matched** to what we already recorded	→	**Odd ones flagged** for a human to look at	→	**Books agree** with the bank

Everything lands in the ledger — one shared, permanent record

...and from it: profit & loss, balance sheet, cash flow, VAT, runway, project profitability

WHY THE NUMBERS CAN BE TRUSTED

Four rules the system enforces — not by policy, but by refusing

These are not guidelines people are asked to follow. The database itself rejects anything that breaks them, including from an administrator.

⚖️ It always balances

Every entry is written twice — money's source and its destination. If the two sides don't match to the cent, the system refuses to save it. An unbalanced book is impossible, not just discouraged.

🔒 Nothing can be erased

A mistake is fixed by posting a visible correction that cancels it out — never by deleting the original. The full history stays, so anyone can see what happened and when.

📅 Closed months stay closed

Once a month is signed off, it is sealed. Nobody can quietly reach back and change a past number to make a later one look better.

👥 Two people, never one

Whoever enters a bill cannot also approve it, and whoever asks for money back cannot approve their own claim. The system checks it is a different person.

THE REMAINING 46%

What isn't built yet

The gaps are deliberate — we built the foundation and the daily money work first, because everything else depends on them being right.

8 features

Salaries & equipment

Payroll posting into the books, and tracking equipment we own as it loses value over time (depreciation). Nothing started — likely to connect to an existing payroll provider rather than rebuild one.

10 features

Deeper cost insight

We can already see profit by project and by department. Still to come: profit by product and region, overhead sharing, unusual-spend alerts, and spotting money spent on things that produced nothing.

3 features

Looking forward

Budgets and cash runway work today. Rolling forecasts and "what if revenue drops 20%" scenario modelling are not built yet.

5 features

Reporting polish

The core statements are live. A custom report builder, click-through from a total down to the individual transaction, and scheduled email delivery are still to do.

5 features

Controls & scale

Spend limits per role, approval delegation, running several companies side by side, and connecting to outside systems (bank feeds, Stripe, payroll).

Next

The honest summary

The company can run its day-to-day finances on this today. What it cannot yet do is pay salaries through it, track owned equipment, or model the future.
